as in the 10V dataset, what is accuracy of classifier using linear and RBF kernel? which of the two has better performance?

Linear Kernel = 100%

RBF Kernel = 100%

Generally RBF performs better but when we have small dataset, we get equal performance.

RBF is more suitable as in dataset is non linear.

For "letter recognition 10V" dataset, present a confusion matrix. Are there any specific letters frequently confused with others? How does the SVM model perform compared to the dataset?

The confusion matrix shows how many times each letter was predicted

rows  $\rightarrow$  actual

columns  $\rightarrow$  predicted

diagonal  $\rightarrow$  correct prediction
